Re: Spring 2017 Potable Well Sampling – Door County Highway Salt Storage Facility (02-15-554088)

3:45pm:

Sarah Frederick called John Kolodziej regarding the June, 2016 sampling results for the two impacted off-site potable wells. John was uncertain of the occupancy status for these two residences; however, the Highway Department is currently providing clean water to these homes. The Highway Department intends to continue monitoring these two impacted wells on annual basis and does not plan to replace the wells at this time given the decreasing trends in sodium/chloride concentrations observed.

Sarah explained that Drinking Water & Groundwater has requested that the next sampling event occur in the spring of 2017 to capture any seasonal variation in concentrations. John agreed, they will plan to sample all three wells (the on-site private well, and the two off-site private wells) in April/May of 2017.

Site Name/BRRTS: Door County Highway Department Salt Storage Facility (BRRTS #02-15-554088)

Re: Potable Well Sampling

Kyle Burton, Drinking Water & Groundwater NER Region Program Manager, recommends regularly sampling any replacement wells associated with the salt release case for at least the first two years after construction. After two years, sampling every other year is recommended as stated in the variance approval for the facility's private well. Kyle Burton requests that the facility's on-site private well be resampled in the spring of 2017.

Re: Door County Highway Department Salt Storage Facility, 2015 GW Results

9am:

Frederick called Kolodziej to discuss the 2015 groundwater sampling results.

Frederick thanked Kolodziej for the recent status update and the submission of the 2015 GW results. Kolodziej clarified that there was indeed a typo on the coverage table – the wells were sampled for both chloride and sodium in 2015.

Frederick inquired as to whether the wells have been replaced as discussed in 2014. Kolodziej explained that the highway shop well was replaced since the 2013 sampling event (well at 10363 STH 57) which accounts for the drop in chloride and sodium levels in the water at that location. The other two wells located at 10392 Northwoods Drive and 10397 STH 57 have not yet been replaced, the properties are vacant and Kolodziej was hoping the sodium and chloride levels would drop over time; however, Kolodziej has approval to go ahead with well replacement.

Kolodziej was unable to obtain access to the 10392 Northwood Drive property for the 2015 sampling event. Frederick asked that Kolodziej notify the department prior to the next sampling event if they experience any difficulty in obtaining access to these two properties. Kolodziej indicated that the wells would likely be sampled again this year.

Frederick inquired as to whether the property owners (despite the vacant occupancy status) had been notified of the sampling results. Frederick explained that under ch. NR 716.14 Wis. Adm. Code, notification must be provided to the property owners of any sampling results within 10-days of receiving the results from the lab. Kolodziej was unsure as to whether the results had been provided to the property owners, but he will confirm with his supervisor and make sure that these notifications are provided in the future.

Sarah confirmed for Kolodziej that all correspondence related to this project should continue to be provided to Kristin DuFresne in the Green Bay office.
